Chatbots Are Designed for Conversation, Not Work

The world has evolved, but Chatbot UI is still stuck in 2023

3 Gaps in current UX -

Knowledge Capture

Users constantly copy useful answers into notes apps

Chatbots act like conversations, not workspaces

Conversation Navigation

Chats become “use-and-forget” instead of reusable knowledge

Important insights get buried in long conversations

Output Control

Users manipulate prompts to control output

This is a workaround for missing UX controls

Typical Chatbot Interface -

Users compensate for these 3 gaps via workarounds

Opportunity - Reimagining chatbots as Notebook styled workspace

Where users can:

- Capture insights
- Navigate smoothly
- Organize chats
- Control outputs directly

How ? -> Using features as shown ahead

Capture Insights Directly from Conversations

Notebook architecture - Knowledge Capture Layer

Save Insight feature -

Highlight useful parts of an AI response and drag it to the right side to save it instantly to the notepad !

- Eliminates copy-paste workflows
- Builds reusable knowledge from conversations

Navigate Long Conversations with Bookmarks

Notebook architecture - Organizing within a chat Layer

Bookmarks + Minimap feature -

MiniMap to navigate Bookmarks across chat

Bookmark important questions and quickly navigate long conversations.

- Save key moments in a discussion
- Jump directly to bookmarked answers

Organize Different Chats

Notebook architecture - Organization across chats Layer

Folders feature -

Group related conversations into project-based folders

- Organize discussions by topic or project
- Turn chats into structured workspaces instead of loose history

Incognito tab feature -

Start temporary conversations that disappear when the session ends

- Useful for quick queries or experimentation
- The chat is not saved or added to history

Control AI Output Without Prompt Hacks

Notebook architecture - Tuning the Output

Length control feature -

Timestamp Context feature -

Adjust how detailed the AI response should be.

- Choose between short, medium, or detailed answers
- Removes the need to prompt for response length like "Summarize in 50 words", "Explain step-by-step with examples" etc.

Allow the AI to understand when messages were sent in long conversations.

- Helps the AI better interpret conversations spanning multiple days
- Once switched on, automatically adds [DD/MM/YY HH:MM:SS] to each message
