Self Pickup - Strategy Design

Ayush Agarwal

Harsh Agrawal

Akrati Pal

Vinita K.

Solution

Stakeholder Priorities

Customer	Ease of access; Safety
Pick Up point	Monetary gains; Less hassle
Meesho	Reducing costs; High adoption

India × Meesho: Key Constraints

Must scale to serve a large, diverse customer base across India

Must remain asset-light with minimal infrastructure dependence

Competitive Benchmarking

Amazon - Lockers
Technically complex to use

Walmart - drive-through
Requires physical store presence

Solution 1 - Self pickup Vans

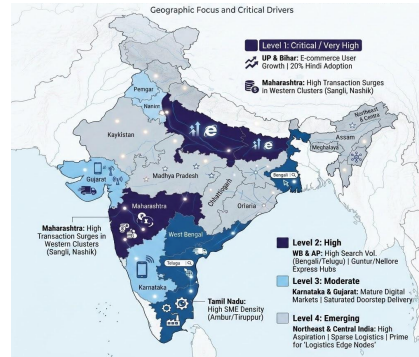

Solution 2 - New restaurants as PUDO centers

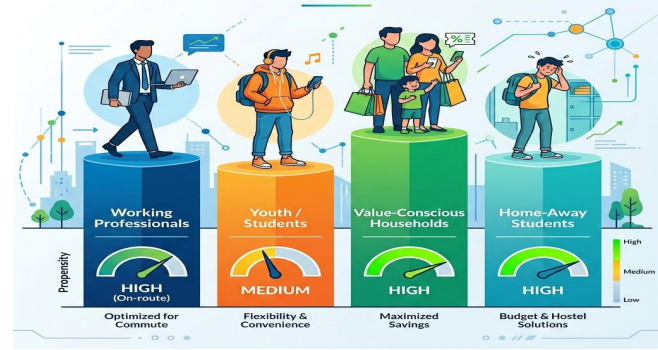

Driving Factors: **Cost savings** (passing last-mile savings to the user), **schedule flexibility**, avoiding "missed delivery" frustration.

Regional Intent and Adoption Potential (based on google search trends)

User Base

USER SEGMENT PROPENSITY TO TRAVEL (1-2 km) Analyzing Willingness to Move for Delivery Pick-up

Benefits and Trade-offs

Benefits

Challenges

Self Pickup Vans

Cheaper than setting PUDO Centers: saves rent, infra costs etc.

Moveable: prevents location lock-in.

Parking spot finding: finding local parkable spots in crowded areas is difficult.

New restaurants as PUDO centers

Amazing customer experience: as compared to distribution center godowns.

Fast expansion possible: boosts mutual discoverability for local restaurants.

Restaurant Verification: Verifying credibility of new restaurants would be slightly difficult.

Women SHGs & Local Transit Drivers as the New Partners

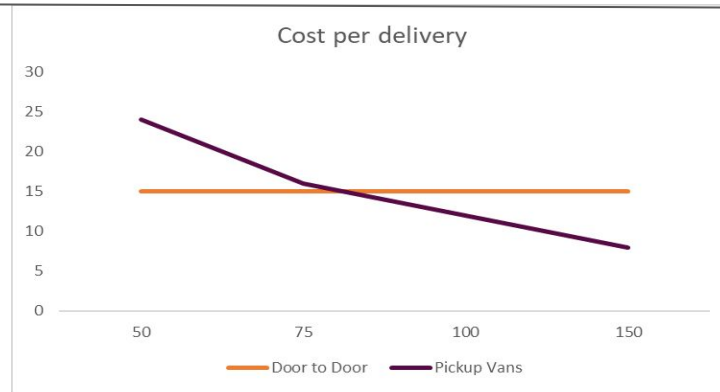

Overcomes rural trust barriers by integrating MSMEs and local entrepreneurs.

Cost Reduction (standalone shops are ₹10,000 for 250 sq ft).

Lack of access to technology.

Adoption challenges due to limited tech proficiency

Self-Pickup Vans Financials

Cluster-Based Pickup Model: Cost & Deployment Overview

Daily Operating Cost (per van)

Van cost: ₹300
Driver cost: ₹700
Fuel & maintenance: ₹200
Total: ₹1,200 per day

Initial Investment

₹90 crore for deployment of 1,500 vans

Deployment Strategy

Target cities with 1,000+ daily deliveries

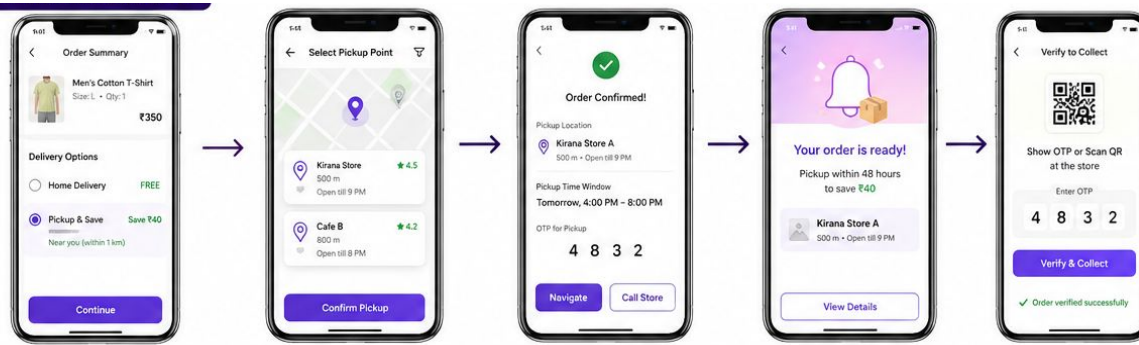

Financial Outlook

Estimated break-even period from cost savings
1 year 7 months

Clustering

Cluster nearby pincodes into zones of 150–200 deliveries per van

Product & Tech Capabilities Required

Awareness & Touchpoints

In-App Promotion:

- * Show a message at checkout like “Save ₹X by picking up from a nearby store” next to home delivery.
- * If a user chooses pickup once, make it the default next time.

External Channels

- * Send location-based reminders on WhatsApp about nearby pickup points.
- * Use banners at local kirana stores (Valmo partners) to create offline awareness.

Technologies

Real Time Notifications - To incentivize faster pickups

Maps Integration - To assist finding the PUDO spot

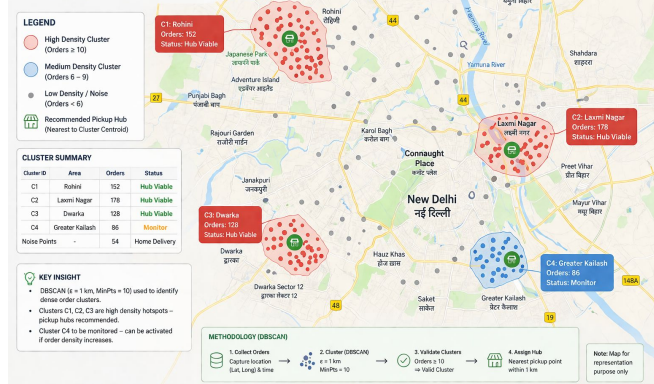

OTP based verification - For ensuring safe transfer of the package

Operations & Support

Grievance System: a clear process to handle issues between drivers, sort centers, and stores.

DBSCAN Clustering of Orders – Delhi

Identifying High Density Hotspots for Pickup Hubs

Pickup point allocation using DBSCAN algorithm (AI)

- * Convert all orders into geo-points using latitude and longitude within a defined time window (6 to 12 hours)
- * For the collected order, identify nearby orders within a **1 km radius** to measure local demand density
- * Residential areas that meet this density threshold are treated as **hotspots** for **pickup hub activation**, while others continue with home delivery

Thank You :)
