20 Revenue Ideas -

B2B ideas:

Data/marketing domain -

1. **B2B DaaS (Data as a Service)** - Selling retail consumption data and insights to FMCG corporations.
2. **Carry bags** - Corporates can deploy cloth carry bags across our stores, thus the bags serving as billboards, as well as assisting us in replacing plastic bags, and achieving CSR metrics.
3. **Marketing service** - Deploying TV sized screens (like Adometer, AdonMob etc) across stores and selling advertisement time-slots to businesses for high customer visibility.
4. **Beta testing service** - Service where a business can introduce a new product, and we will test it across our stores and deliver insights on the new product.

Platform creation domain -

1. **Vending Machines** - corporations can deploy their own vending machines at our stores for rent.
2. **Supporting Local businesses** - Local businesses can partner with our stores and keep their items for sale, for a percent commission. This will also lead to local development, and marketplace creation.

Service Extension domain/Others -

1. **PUDO (Pick Up Drop Off) Centers** - E-commerce and Q-commerce can partner with our stores, utilizing spare spaces for delivery items. This reduces the burden of finding the exact house for the delivery companies, as well as increases footfall for our stores.
2. **Temporary stall rentals** - Just like how credit card companies often rent out spaces inside malls for a few weeks, we can similarly rent out spaces in our stores to businesses for their experiments.
3. **Information marketplace** - AgriTech startups can deploy kiosks at our store, with AI models for assisting local farmers with scientific guidance regarding the agriculture domain, such as pest alerts, weather updates, and crop planning. By facilitating this connection via our existing infrastructure, we can earn commissions from startups.

B2C ideas:

New product offerings -

1. **Tea/Snacks stalls** - Quick consumption food items have high demand, specially during intensive monotonous tasks such as grocery shopping, thus adding an additional stream of revenue. Samosas and patties have a high demand in such regions.
2. **Snacks division itself** - We can start selling snacks such as chips and biscuits, as there are often impulsive purchases.
3. **Printer service** - Blinkit printers have been very successful in tier 1 and 2 cities, and since the core demands of human livelihoods are the same, we can expect a similar demand in our target markets too.
4. **Dehydrated Fruits/Vegetables** - Dehydration units are easily available, and can create innovative and unique offerings which might not be commercially available previously.
5. **Health centric offerings** - Since we already sell groceries, fruits and vegetables, it would be an easy value adding pivot to also sell fresh fruit salads, juices, shakes etc.
6. **Stationary store** - Stationary items like pencil, notebooks create recurring demand from students, thus increasing customer stickiness.

New strategies -

1. **Subscription model on app** - Users can subscribe to monthly deliveries for some commodities, thus increasing product stickiness and hence customer loyalty.
2. **Street Hawkers** - Street hawkers can be hired to sell impulse goods like biscuits, chips etc by the roadside. Simply put, "if the customer doesn't come to us, then we go to the customer". Such hawkers can be deployed near the school side targeting younger audiences.
3. **Delivery** - Using SuperK's existing logistics, can provide courier service at cheaper rates than the existing options in the market. This can also include Amazon like services which SuperK will be able to fulfill faster.
4. **Buy-Now-Pay-Later model** - Have a Buy-Now-Pay-Later model as well. Since kirana stores are operational within a small perimeter, this is already a common practice. So, implementing this as a part of the app with confirmation from the shopkeeper on their jurisdiction as to whom to let the loan to can be a natural integration.
5. **Handicraft exposure** - For places which have locally made handicrafts, provide them with a market place to sell via online means through SuperK at tier 1 and 2 cities.

Opportunity Landscape -

- Booming demand for "bigbazaar" like shopping experience in smaller towns as opposed to kirana stores.
- Rise in demand for quick commerce
- Increasing digitization
- GenZ is exhibiting a greater receptivity toward novel flavors and experimental offerings, encompassing both premium and international brands, thereby driving up the overall market demand for these specialized goods.
- Larger companies' need for a large scale of data

Key Challenges -

- Linguistic barriers in rural areas
- Technical Literacy issues with older customer segments
- Low overall demand - small towns have smaller populations, thus even a single bad harvest season could negatively impact our sales without any intrinsic fault.
